

## 1 Grammar

$$\rho ::= x \quad \text{primitives}$$

$$| \quad r$$

$$\tau_\rho ::= \{r\} \quad \text{primitive types}$$

$$e_u ::= \rho \quad \text{deeply unlabeled progs.}$$

$$| \quad \text{new}_d x \Rightarrow \overline{d = e_u}$$

$$| \quad e_u.m(e_u)$$

$$| \quad e_u.\pi$$

$$d ::= \text{def } m(y : \tau_u) : \tau_u \quad e_u\text{-prog decls.}$$

$$\tau_u ::= \{\bar{d}\} \quad e_u\text{-prog types}$$

$$| \quad \tau_\rho$$

$$e_l ::= \rho \quad \text{deeply labeled progs.}$$

$$| \quad \text{new}_\sigma x \Rightarrow \overline{\sigma = e_l}$$

$$| \quad l.m(l)$$

$$| \quad l.\pi$$

$$\sigma ::= \text{def } m(y : \tau_l) : \tau_l \text{ with } \varepsilon \quad e_l\text{-prog decls.}$$

$$\tau_l ::= \{\bar{\sigma}\} \quad e_l\text{-prog types}$$

$$| \quad \tau_\rho$$

$$e ::= \rho \quad \text{progs.}$$

$$| \quad e.m(e)$$

$$| \quad e.\pi$$

$$| \quad \text{new}_d x \Rightarrow \overline{d = e_u}$$

$$| \quad \text{new}_\sigma x \Rightarrow \overline{\sigma = e}$$

$$\tau ::= \tau_l \quad \text{types}$$

$$| \quad \tau_u$$

### Notes:

- $e_u$  programs are *deeply unlabeled* programs: no labels appear in the source code (though label inference may be done by the type system).
- $e_l$  programs are *deeply labeled* programs: everything in the source code is labeled.
- $e$  programs are the general form of a syntactically-correct program. They may contain a mixture of labeled and unlabeled parts. Any unlabeled parts must be deeply unlabeled, but labeled parts need not be deeply labeled. This means you can have unlabeled parts appearing inside labeled parts, but not vice versa.
- Any  $e_l$  or  $e_u$  term is also an  $e$  term.

## 2 Static Semantics

$$\boxed{\Gamma \vdash \rho : \tau}$$

$$\frac{}{\Gamma, x : \tau \vdash x : \tau} (\rho\text{-VAR}) \quad \frac{}{\Gamma, r : \{r\} \vdash r : \{r\}} (\rho\text{-RESOURCE})$$

\frac{\Gamma \vdash \tau'_1 <: \tau_1 \quad \Gamma \vdash \tau_2 <: \tau'_2}{\Gamma \vdash d_i <:: d_j} \text{ (ST-METHOD}_d\text{)}
\end{array}$$

#### Notes:

- A good choice of  $\Gamma'$  for  $e_u\text{-NEW}_\varepsilon$  is the intersection of  $\Gamma$  with the free variables in the object.
- By convention we use  $\varepsilon_c$  to denote the output of the **effects** function.

### 3 Definition: effects Function

The **effects** function returns the set of effects captured in a particular context.

- $\text{effects}(\emptyset) = \emptyset$
- $\text{effects}(\Gamma, x : \tau) = \text{effects}(\Gamma) \cup \text{effects}(\tau)$
- $\text{effects}(\{\bar{r}\}) = \{(r, \pi) \mid r \in \bar{r}, \pi \in \Pi\}$
- $\text{effects}(\{\bar{\sigma}\}) = \bigcup_{\sigma \in \bar{\sigma}} \text{effects}(\sigma)$
- $\text{effects}(\{\bar{d}\}) = \bigcup_{d \in \bar{d}} \text{effects}(d)$
- $\text{effects}(d \text{ with } \varepsilon) = \varepsilon \cup \text{effects}(d)$
- $\text{effects}(\text{def } m(x : \tau_1) : \tau_2) = \text{effects}(\tau_2)$

–  $\text{effects}(\{\bar{d} \text{ captures } \varepsilon_c\}) = \varepsilon_c$

**Notes:**

1. The function is monotonic: if  $\Gamma_1 \subseteq \Gamma_2$ , then  $\text{effects}(\Gamma_1) \subseteq \text{effects}(\Gamma_2)$ .

## 4 Dynamic Semantics

$$\boxed{e_u \longrightarrow e_u \mid \varepsilon}$$

$$\frac{e_{u,1} \longrightarrow e'_{u,1} \mid \varepsilon}{e_{u,1}.m(e_{u,2}) \longrightarrow e'_{u,1}.m(e_{u,2}) \mid \varepsilon} \text{ (E-METHCALL1)}$$

$$\frac{v_{u,1} = \text{new}_\sigma x \Rightarrow \overline{\sigma = l} \quad e_{u,2} \longrightarrow e'_{u,2} \mid \varepsilon}{v_{u,1}.m(e_{u,2}) \longrightarrow v_{u,1}.m(e'_{u,2}) \mid \varepsilon} \text{ (E-METHCALL2)}$$

$$\frac{v_1 = \text{new}_d x \Rightarrow \overline{d = u} \quad \text{def } m(y : \tau_1) : \tau_2 = e_u \in \overline{d = e_u}}{v_1.m(v_2) \longrightarrow [v_1/x, v_2/y]e_u \mid \emptyset} \text{ (E-METHCALL3)}$$

$$\frac{e_{u,1} \longrightarrow e'_{u,1} \mid \varepsilon}{e_{u,1}.\pi \longrightarrow e'_{u,1}.\pi \mid \varepsilon} \text{ (E-OPERCALL1)} \quad \frac{}{r.\pi \longrightarrow \text{unit} \mid \{r.\pi\}} \text{ (E-OPERCALL2)}$$

$$\boxed{e_u \longrightarrow_* e_u \mid \varepsilon}$$

$$\frac{}{e_u \longrightarrow_* e_u \mid \emptyset} \text{ (E-MULTISTEP1)} \quad \frac{e_u \longrightarrow e'_u \mid \varepsilon}{e_u \longrightarrow_* e'_u \mid \varepsilon} \text{ (E-MULTISTEP2)}$$

$$\frac{e_u \longrightarrow_* e'_u \mid \varepsilon_1 \quad e' \longrightarrow_* e'' \mid \varepsilon_2}{e_u \longrightarrow_* e''_u \mid \varepsilon_1 \cup \varepsilon_2} \text{ (E-MULTISTEP3)}$$

**Notes:**

- The runtime only operates on (deeply) unlabeled expressions. You may think of a compiler as stripping all the effect labels from a program before execution.

## 5 Lemma (Canonical Forms)

TODO

## 6 Definition (substitution)

TODO

## 7 Lemma (Substitution)

**Lemma.** Suppose the following is true:

1.  $\Gamma, z : \tau' \vdash e : \tau$  with  $\varepsilon$
2.  $\Gamma \vdash e' : \tau'$  with  $\varepsilon'$

Then  $\Gamma \vdash [e'/z]e : \tau$  with  $\varepsilon$ .

**Proof.** TODO (Should be same as the proof in previous grammar, just need to convert everything to new grammar)

## 8 Definition (label)

A program may be converted into a fully-labeled program. This is a function from  $e$ -terms to  $e_l$ -terms. It is always defined relative to some  $\Gamma$ , which is usually clear from context. The process is well-defined on  $e$  if  $\Gamma \vdash e : \tau$  with  $\varepsilon$ . Then **label** is defined below.

1.  $\text{label}(\rho) = \rho$
2.  $\text{label}(e_1.\pi) = \text{label}(e_1).\pi$
3.  $\text{label}(e_1.m(e_2)) = \text{label}(e_1).m(\text{label}(e_2))$
4.  $\text{label}(\text{new}_d x \Rightarrow \overline{d = e_u}) = \text{new}_\sigma x \Rightarrow \overline{\text{label-decl}(d = e_u)}$
5.  $\text{label}(\text{new}_\sigma x \Rightarrow \overline{\sigma = e}) = \text{new}_\sigma x \Rightarrow \overline{\sigma = \text{label}(e)}$

The helper function **label-decl** works by labeling each declaration with what it captures in the context  $\Gamma$ . We abbreviate this as **effects**( $\Gamma \cap \text{freevars}(e)$ ). The helper is defined below.

5.  $\text{label-decl}(d = u) = d$  with  $\text{effects}(\Gamma \cap \text{freevars}(e)) = \text{label}(u)$

**Notes:**

- The image of  $\text{label}(e_u)$  is an  $e_l$ -term (proof by induction on definition).
- $e_u$  is a value  $\iff \text{label}(e_u)$  is a value.
- We can define  $\emptyset \cap \text{freevars}(e)$  as  $\emptyset$ , and  $(\Gamma, x : \tau) \cap \text{freevars}(e)$  as  $(\Gamma \cap \text{freevars}(e)) \cup (\{x\} \cap \text{freevars}(e))$ .

## 9 Definition (unlabel)

The inverse of **label**. TODO

## 10 Theorem (label and sub Commute)

TODO

## 11 Theorem (Soundness)

**Theorem.** Suppose  $\Gamma \vdash e_A : \tau_A$  and  $e \longrightarrow e_B \mid \varepsilon$ . The following are true:

1.  $\Gamma \vdash e_B : \tau_B$  with  $\varepsilon_B$
2.  $\tau_B <: \tau_A$
3.  $\varepsilon_B \cup \varepsilon = \varepsilon_A$

**Proof.**
